

48 eight-core optical cables

Overview

48 Core GYTC8S Figure-8 Fiber Optic Cable Price & Datasheet This kind of cable is specifically used for self supporting aerial installation. The mental stre.

Key Takeaways

A 48 eight-core optical cable is a fiber optic cable containing 48 individual fibers, each organized in groups of eight cores, designed for high-capacity data transmission in outdoor or aerial installations. Structure and Design

A "48 eight-core" cable typically contains 48 optical fibers, arranged in six groups of eight fibers each. Each group, or "core bundle," is housed in a loose tube made of high-modulus plastic, which protects the fibers and allows flexibility. These loose tubes are then stranded around a central strength member, often made of steel or aluminum, to provide mechanical support and tensile strength . The cable may include water-blocking materials to prevent moisture ingress and a PE outer sheath for environmental protection . Some 48-core cables are designed as self-supporting aerial cables, such as the GYTC8S type, which features a figure-8 structure with stranded steel wires for support, making them suitable for direct aerial installation without additional support . Others, like OPGW (Optical Ground Wire) 48-core cables, combine lightning protection with high-speed optical communication, typically installed on high-voltage transmission lines .

Applications

48 eight-core optical cables are used in scenarios requiring high-capacity data transmission and long-distance communication, including:

- Telecommunication networks for backbone or metro fiber deployments .
- Smart grid and utility networks, where OPGW cables provide both grounding and communication .
- Outdoor aerial installations, where self-supporting designs reduce the need for additional infrastructure .
- Duct or buried installations, with armored variants providing crush and moisture resistance .

Capacity and Management

The core count determines the number of simultaneous connections or distribution points a cable can support. A 48-core cable allows for future expansion, as unused fibers can be reserved for later use . High core density increases distribution capacity but also requires careful routing and management during installation . Color-coding systems, such as the TIA-598-C standard, are used to identify individual fibers within high-count cables, ensuring proper connection and maintenance .

Summary

In essence, a 48 eight-core optical cable is a high-capacity fiber optic solution, structured in multiple eight-fiber bundles, designed for robust, long-distance, and high-speed communication. Its design can be customized for aerial, duct, or buried installations, with options for armoring, water-blocking, and self-supporting structures to meet environmental and mechanical requirements .
