

Does the optical splitter have a backend interface

Overview

The splitters are stand-alone, not co-located with other splitters. In this scenario, the splitter is most often located in a closure or pedestal in the outside plant.

Key Takeaways

The optical splitter has one upstream optical interface and several downstream optical interfaces. In the backbone of modern Fiber-to-the-Home (FTTH) networks, optical splitters serve as the unsung heroes that enable cost-efficient connectivity for millions of subscribers. Rarely, there can be two inputs to provide potential redundancy of route. Light power goes in and light power coming out of the various legs is reduced in. Optical splitters and couplers split or combine light—distributing signals injected into a single fiber strand to multiple fibers, enabling point to multi-point communication in Fiber To The Home (FTTH) networks based on ITU. T PON standards such as GPON, XGS-PON and new 25 and 50G standards. Its primary role is in Passive Optical Networks (PON), which are the foundation of.
