

How to cut the optical fiber in an optical fiber sensor

Overview

2 If the fiber unit is a free cut type, cut any excess length of the fiber. (1) Insert the fiber into the hole in the cutter.

Key Takeaways

Use a fiber cleaver or fiber cutter to achieve a clean, precise cut that minimizes signal loss and ensures proper sensor performance.

Tools Needed

- Fiber Cleaver: A precision tool that scores and fractures the fiber to create a smooth, near-perfect 90° end face, essential for low-loss splicing or connector termination .
 - Fiber Cutter: For free-cut fiber units, a dedicated cutter like the KEYENCE OP-87098 can be used to cut the fiber in a single motion .
 - Fiber Stripper: To remove the protective coating before cleaving, exposing the bare glass fiber .
 - Cleaning Supplies: Alcohol wipes or lint-free cloths to clean the fiber before and after cutting.
- Step-by-Step Procedure
- Strip the Fiber: Remove 3–4 cm of the fiber coating using a fiber stripper to expose the glass core .
 - Clean the Fiber: Wipe the bare fiber with alcohol to remove debris and contaminants .

- **Position the Fiber:** Place the fiber flush against the cleaver's alignment groove or insert it into the fiber cutter's designated hole, following the manufacturer's instructions .

- **Cut the Fiber:**

- For a fiber cleaver, the tool scores the fiber with a diamond or tungsten carbide blade, then applies tension to fracture the fiber cleanly along the score line, producing a cleave angle typically less than 0.5° .

- For a fiber cutter, bring down the blade in a single, swift motion without stopping halfway, and avoid using the same hole twice .

- **Inspect the Cut:** Ensure the end face is smooth and perpendicular (or at the required angle for APC/UPC connectors) to prevent signal loss or splice failure .

Tips and Precautions

- Always handle bare fibers carefully to avoid injury; glass shards can be sharp.

- Avoid rough or angled cuts, as even a 1° cleave error can increase splice loss by 0.5 dB .

- Clean the fiber thoroughly before splicing or connecting to maintain optimal sensor performance.

- Use proper disposal methods for fiber scraps to prevent accidents. By following these steps and using the correct tools, you can cut optical fibers safely and precisely, ensuring reliable operation of optical fiber sensors and minimizing signal degradation .

2 If the fiber unit is a free cut type, cut any excess length of the fiber. (1) Insert the fiber into the hole in the cutter. (2) Bring down the

Fiber Cleaver: How to Achieve Precise & Clean Optical Fiber

A fiber cleaver is a precision tool designed to cut optical fibers with near-perfect 90° end faces—critical for low-loss

How to Properly Strip, Cut, and Test Fiber Optic Cables?

In fiber optic installations, precision is critical to maintaining optimal signal transmission. Optical fiber strippers and cutting tools play

Cutting optical fiber without fiber cleaver : r/Optics

Dissolve the cladding, place the exposed fiber onto a rubberised or soft mat, apply the gentlest pressure with a razor (just a light tap),

Can you cut fiber optic light cable?

However, cutting fiber optic cables requires precision and the right tools to ensure the integrity of the optical fibers and maintain

Fiber-Optic Cable Cutters | McMaster-Carr

Choose from our selection of fiber-optic cable cutters, including sawing, cutting, and scraping, fiber-optic tool kits, and more. Same

How To Cut A Fiber Optic Cable

For connectors, use a fiber termination kit to install connectors like SC, ST, or LC at the end of each fiber. 7. Test the

Can you cut fiber optic light cable?

After cutting, the fiber optic cable is typically ready for further steps such as splicing or connectorization, depending on the

Fiber Optic Sensing Technology: What It Is and How it Works

This article explains what fiber optics are and how they work in industrial applications. Learn important terms and the basics of fiber

Fiber Optic Sensor

Fiber optic sensors are defined as sensing devices that utilize optical fibers to convert lightwave properties into information about the

How to Terminate Fiber Optic Cable Fast and Easily

Fiber optic termination is a necessary step for installing a fiber optic network. It is a physical connection of a fiber optic

Fiber Optic Sensors: Fundamentals and Applications

D L] 0 Phase change of a light wave through an optical fiber of original length L that has been stretched by a length ΔL versus relative

What is the best way to cut fiber optic cable?

Cutting fiber optic cable is a delicate process that requires precision and care to ensure the integrity of the cable is maintained. Fiber

Fiber-Optic Sensing Technologies

Fundamentally, a fiber-optic sensor works by modulating one or more properties of a propagating light wave, including intensity,
