

How to replace the pigtail cable in a fiber optic patch cord

Overview

How to Install Fiber Optic Pigtails (Step-by-Step Guide) Remove the outer coating carefully to expose the fiber. Use alcohol wipes to remove dust and debris.

Key Takeaways

Replacing a fiber optic pigtail involves carefully removing the old pigtail, preparing the fiber, and splicing a new pigtail using either fusion or mechanical splicing for a low-loss connection. Step 1: Gather Tools and Materials

You will need:

- A new fiber optic pigtail of the correct type (single-mode or multimode, matching connector type)
 - Fiber stripper and cleaver
 - Fusion splicer or mechanical splice kit
 - Isopropyl alcohol and lint-free wipes
 - Protective sleeves or splice tray
 - Patch cord tester or optical power meter for verification
- Step 2: Remove the Old Pigtail
- Disconnect the patch cord from any equipment or adapters.

- Open the splice tray or termination box where the pigtail is installed.
- Carefully remove the old pigtail from the splice holder, taking care not to damage the incoming fiber .

Step 3: Prepare the Fiber

- Strip the protective coating from the bare fiber end of the new pigtail using a fiber stripper.
- Clean the exposed fiber with isopropyl alcohol to remove any debris.
- Cleave the fiber to create a smooth, flat end for splicing .

Step 4: Splice the New Pigtail

- Fusion Splicing: Align the bare fiber of the pigtail with the incoming fiber in the fusion splicer. The splicer will fuse the fibers together, creating a permanent, low-loss joint.

- Mechanical Splicing: Insert the fibers into a mechanical splice holder, ensuring proper alignment. The splice uses an index-matching gel or adhesive to transmit light efficiently .

Step 5: Protect the Splice

- Place the spliced fiber into a protective sleeve or splice tray to prevent bending or damage.

- Ensure the fiber is neatly routed and secured inside the termination box .

Step 6: Test the Connection

- Use a patch cord tester or optical power meter to verify signal integrity.
- Check for low insertion loss and minimal back reflection.
- If the test fails, inspect the splice and redo if necessary .

Step 7: Reconnect and Label

- Connect the new pigtail to the patch panel or equipment port.
- Label the pigtail for easy identification and future maintenance . Tips:
 - Always match the fiber type (single-mode or multimode) and connector type (LC, SC, ST) to the existing network.
 - Order slightly longer pigtails than needed to allow slack for adjustments.
 - Keep a test patch cord on hand to verify ports before final installation . By following these steps, you can replace a fiber optic pigtail safely and maintain optimal network performance.
