Key Takeaways

Wiring a TT distribution box involves connecting the live (L), neutral (N), and protective earth (PE) conductors to the main earthing terminal (MET) and ensuring RCD protection for safety. Understanding the TT System

A TT system has the source neutral earthed at the transformer, while the consumer installation uses its own independent earth electrode. The protective earth (PE) from this electrode connects to all exposed conductive parts of the installation, and there is no metallic connection back to the supply PE (). This system relies on RCDs for fault protection because the soil return path has high impedance ().

Step-by-Step Wiring

- Install the Main Earthing Terminal (MET)
- Drive a copper-clad steel rod or similar electrode into the ground near the building entry.
- Connect the PE conductor from this electrode to the MET.
- Connect Incoming Supply Conductors
- For a three-phase supply: connect L1, L2, L3, and N to the corresponding terminals in the distribution box.
- Ensure the neutral is isolated from the PE within the consumer installation.

- Distribute Protective Earth (PE)
- Run the PE conductor from the MET to all equipment enclosures, sockets, and exposed conductive parts.
- Use proper color coding (green/yellow) for PE wires.
- Install RCDs and Circuit Breakers
- Each circuit should be protected by an RCD (≤ 30 mA) to disconnect faults reliably ().
- Connect the live and neutral of each circuit through the RCD to the respective outgoing terminals.
- MCBs can be installed downstream of RCDs for overcurrent protection.
- Connect Final Circuits
- Connect individual circuits (lighting, sockets, appliances) to the MCBs or RCBOs.
- Ensure the PE from each circuit is connected back to the MET.
- Testing and Verification
- Measure earth resistance to ensure it is within safe limits.
- Test RCD operation to confirm proper tripping under fault conditions.
- Verify all connections are tight and color-coded correctly.

Safety Considerations

- TT systems depend on RCDs because the fault loop impedance is high ().
- Maximum disconnection time for protective devices is 1 second for general circuits ().
- Ensure selectivity between RCDs if multiple are installed.
- Avoid connecting the consumer PE to the supply neutral or metallic earths from other installations. By following these steps, a TT distribution box can be safely wired, providing reliable protection against electric shock and ensuring compliance with IEC 60364 standards ().
