

## Lc-sc fiber optic interface

### Overview

LC vs SC vs FC vs ST: A Complete Fiber Optic Connector Guide Compare LC, SC, FC & ST fiber-optic connectors — size, coupling, and ideal use cases — to help.

### Key Takeaways

LC connectors are compact, high-density interfaces ideal for modern SFP modules, while SC connectors are larger, robust connectors commonly used in legacy networks. Overview of LC and SC Connectors

LC (Lucent Connector) uses a 1.25 mm ferrule and a push-pull latch mechanism, making it suitable for high-density environments such as data centers, telecom networks, and high-speed applications like 10G, 40G, and 100G systems. Its small size allows duplex channels in a compact footprint without compromising handling, and it is compatible with both single-mode and multimode fibers. SC (Subscriber Connector) features a 2.5 mm ferrule with a square snap-in housing for secure connections. SC connectors are larger and more durable, making them ideal for enterprise networks, FTTH setups, and older infrastructure. They also support single-mode and multimode fibers and are often found in legacy industrial and campus networks.

#### Key Differences

- **Size:** LC connectors are significantly smaller than SC connectors, allowing higher port density on patch panels and transceiver cages.
- **Coupling Mechanism:** LC uses a latch-based push-pull system, while SC employs a snap-in mechanism.

- Applications: LC is preferred for modern SFP/SFP+ and QSFP breakout connections, whereas SC is common in legacy networks and test equipment .
  - Durability: SC connectors are more robust and easier to handle in rough environments, while LC connectors prioritize space efficiency .
- Use in SFP Modules

Most SFP fiber optic modules use LC connectors due to their compact size and high-density compatibility. SC connectors are generally found in older networks or for specific legacy equipment. Using the correct connector type is crucial to avoid mismatches, additional insertion loss, or operational complexity .

### Summary

Choosing between LC and SC depends on your network requirements: LC connectors are ideal for high-density, high-speed modern networks, while SC connectors are suitable for durability and legacy systems. Both connector types support single-mode and multimode fibers, but their size, coupling mechanism, and typical applications differ significantly .
