This guide gives a practical, CLI-focused workflow for checking SFP health and diagnostics on Cisco switches, shows the exact commands you'll use, explains what the numbers mean, and compares OEM (Cisco) vs third-party modules so you can pick the right SFP module supplier for. This guide gives a practical, CLI-focused workflow for checking SFP health and diagnostics on Cisco switches, shows the exact commands you'll use, explains what the numbers mean, and compares OEM (Cisco) vs third-party modules so you can pick the right SFP module supplier for. An SFP module is a hot-swappable transceiver that converts electrical signals into optical (or electrical, in copper variants) signals. It enables flexible connectivity between networking devices and supports different speeds, wavelengths, and distances. Most Cisco optics also support Digital. If you run fiber or copper uplinks in a small office, home lab, or data closet, SFPs (and SFP+) are the little parts that keep your links alive. Knowing how to view SFP module details helps network engineers verify installation, monitor performance, troubleshoot issues, and maintain. This guide uses the Molextek SFP-25G-SR optical module connected to a Cisco C9300 switch as an example. It is a compact, hot-pluggable transceiver module used for both telecommunication and data communication applications. It supports both single-mode and multi-mode fiber cables and is. The ethtool command enables you to query or control the network driver and hardware settings. It takes the device name (like swp1) as an argument. See man ethtool(8) for details.
