

## PoE switch cascading power supply

### Overview

Cascading means that the switch is connected to the next layer of switches to extend the distance of the network cable, but only up to 5 levels can be cascaded, and the layer cascaded to the network terminal is then connected to the POE switch for power supply. Switches and switch connections are generally available in these two modes: cascading and stacking. The cascade is further divided into ports, here we will focus on two types of cascade, the normal port cascade and the UPLINK port cascade. Use UPLINK port cascading Cascading means that the switch. PoE switches (Type 1) comply with the IEEE 802.3af standard, which specifies the maximum power delivered over Ethernet cables. 4 watts of power per port, while PDs can consume up to 12. Using PoE power has a lot of benefits: Lower bill-of-materials costs because there is no need for a wall adapter or local power supply, nor is there a need for professional. In this configuration, an Ethernet connection includes Power over Ethernet (PoE) (gray cable looping below), and a PoE splitter provides a separate data cable (gray, looping above) and power cable (black, also looping above) for a wireless access point. Using PoE can improve flexible options for placing Ethernet end devices, and reduce the time and expense of installing electrical. Contec has developed a new compact embedded PoE switching hub that supports a wide range of power supply inputs (12 to 54 VDC) and enables cascade connections to link multiple instances of this product.
